

Accessory Instructions and Care

We love to hear from biofeedback practitioners. They are always excited about using the software to help others. And why shouldn't they be? This is a wonderful tool to assist the body in achieving whole body/mind/spirit health. Accessories are a very useful addition to any biofeedback session. They help biofeedback practitioners achieve optimal results. So, you can imagine that a very common question is, "How do I use my accessories?"

Attaching Accessories

Where do you plug in the accessories/point probes? It depends. In 2007 and newer SCIO's you can use the Red, Yellow, and Blue ports. In 2006 and older SCIOs it's only the Red port. On QUEST 9, INDIGO, and Educator devices, you may use the Red, Yellow, and Blue ports. On the QXCI you will only use the Red port. The Generation I Educator (2013 Model) needs the Accessory Splitter Box to use accessories. The Generation II Educator (2014 and newer Model) may use the Red, Yellow, and Blue ports. Red is the preferred port as it outputs full power. The Yellow and Blue ports do output but not at full power. Here is a table to clear things up:

	RED PORT	YELLOW PORT	BLUE PORT	BLACK PORT
QUEST 9	YES	YES	YES	
Educator Gen I (2013 Model)	The Educator Gen I does not have accessory ports. To use accessories you must use the Accessory Splitter Box available at www.serioussmarttechnologies.com			
Educator Gen II (2014 + Model)	YES, preferred port	YES	YES	
INDIGO/Educator	YES	YES	YES	
SCIO – 2007+	YES	YES	YES	
SCIO – 2006 or older	YES			
QXCI	YES			

Special note #1: DO NOT plug in any of the accessories into the back of the device until after "TEST". You may have the accessory on the client with the cable connected to the accessory. However, do not plug it into the back of the device until after "TEST".

Special note #2: There is a set amount of power to send to the harness and accessories. The accessories that you have plugged into your biofeedback device will diminish the overall available power going out.

Activating The Point Probe

In the main panel of the biofeedback software, click System Power Settings and then click Activate Point probe. In the Disease Dictionary panel, you may also choose to check the box named "If Checked- Point Probe Boost Active". In the Skin Rejuvenation panel, some of the buttons, when clicked, may cause a popup that says "Point Probe Amplification Active". This indicates the "zap" would be more effective with a point probe plugged into the Red port and used on that specific part of the body. This is not required to do but it makes the "zap" more effective. Having the point probe on does not turn off the harness. You still need to have all FIVE main points (Head, both ankles, both wrists) connected so the software can see how your body is reacting. Remember, items plugged into the Red, Yellow or Blue ports of the biofeedback devices are OUTPUT ONLY. For true biofeedback you still need your harness system plugged into the biofeedback device.

Specific Protocols

We are not able to include specific protocols with the accessories. Normally, practitioners are given methods of use at training events or on training webinars. What we can tell you is that the biofeedback software is amazing and you can use the accessories in a lot of ways. You are the only limitation in the use of the accessories. So go to town, as it were. There are so many panels where accessories can be used. For weight loss, large-area work, cellulite, pain management, circulation, varicose veins, and so on. The Body Scan and Rejuvenation panel has many wonderful options. Some have also used the Short Sarcodes panel. For more specific suggestions we do offer a few useful tools: [Effective Use of Harness and Accessories Training Video](#), [A-Z Protocols](#), [Quantum Encyclopedia](#) that includes the A-Z Manual.

Accessory Care and Maintenance

Fabric Accessories

This category would include the silver-lined face veil and microfleece blankets. These may be hand washed or machine washed on Cool, Delicate Cycle using no Corrosive and/or no Phosphate Gentle Soap. Woolite is an option. No Bromine, Chlorine, and/or Fluorine. We strongly recommend using the [SmartKlean LAUNDRY BALL](#) which can be purchased from our website. It is natural, safe, gentle, and does not use chemicals. DO NOT MACHINE DRY. Please hang to dry. Normal use may result in the silver fabric tarnishing, just as a new silver coin will tarnish after it is touched. Sulfur (body salts) will speed up the tarnishing process. Tarnished spotting will not diminish the transfer of ions. We have chosen not to treat the medical/surgical grade silver fabric with any Anti-Tarnish coatings as these coatings have not been approved by the FDA. The Medical Industry stays away from coatings for this reason.

Rubber Accessories/Harnesses/Cords

[PROTEX or TRANSEPTIC® CLEANING SOLUTION](#) is the official cleaning solutions for rubber accessories, harness systems, and cords. If these solutions are not available you may use warm soapy water. You will want to avoid essential oils, alcohol, and abrasives. These will degrade the rubber. [SIGNASPRAY or SIGNAGEL](#) are recommended for skin preparation with all rubber accessories.

Metal Accessories with Silver Plating

[PROTEX or TRANSEPTIC® CLEANING SOLUTION](#) is the official cleaning solution for metal accessories. If these solutions are not available you may use warm soapy water. If you wish to remove the tarnish from your solid silver-plated accessories, you may use a silver polish cloth.

Using accessories can make your sessions more effective. We just want you to know that you have permission to be Amazing!
